Enviro-Septic<sup>®</sup> is a registered trademark of Presby Environmental Inc. © 2010-2016 Presby Environmental, Inc. All rights reserved

This manual refers to the October 24, 2011 Certification for General Use and the November 8, 2011 Remedial Use Approval issued by the Commonwealth of Massachusetts Department of Environmental Protection.

All vendors, distributors, and resellers must provide each purchaser of the System with copies of applicable Certification or Approval.

To access the Certification for General Use, please go to http://www.mass.gov/eea/docs/dep/water/wastewater/w-thru-z/w055433.pdf

To access the Remedial Use Approval, please go to http://www.mass.gov/eea/docs/dep/water/wastewater/w-thru-z/x233395.pdf

Date of issue: December 29, 2016

#### Enviro-Septic<sup>®</sup> Wastewater Treatment System Massachusetts Design and Installation Manual

#### Preview

What our system does	By utilizing simple, yet effective natural processes, the Enviro-Septic <sup>®</sup> wastewater treatment system treats septic tank effluent in a manner that prevents solids from entering surrounding soils, increases system aeration, and provides a greater bacterial area (biomat) than traditional systems.
Why our system excels	The Enviro-Septic <sup>®</sup> wastewater treatment system retains solids in its pipe and provides multiple bacterial surfaces to treat effluent prior to its contact with the soil. The continual cycling of effluent (the rising and falling of liquid inside the pipe) enhances bacterial growth. No other design offers this functionality. Our systems excel because they are more efficient, last longer, and have a minimal environmental impact.

#### Preview, Continued

**Pipe section** Here's a cross section diagram of Enviro-Septic<sup>®</sup> pipe. **diagram** 

#### How it works

These are the nine stages in the Enviro-Septic<sup>®</sup> wastewater treatment system.

Stage	What Happens
1	Warm effluent enters the pipe and is cooled to ground temperature.
2	Suspended solids separate from the cooled liquid effluent.
3	Skimmers further capture grease and suspended solids from the
	effluent as it exits through perforations in the pipe.
4	Pipe ridges allow the effluent to flow uninterrupted around the
	circumference of the pipe and aid in cooling.
5	A mat of random, coarse fibers separates more suspended solids
	from the effluent.
6	Effluent passes into the geo-textile fabric and grows a protected
	bacterial surface.
7	Sand wicks the liquid from the geo-textile fabric and enables air to
	transfer to the bacterial surface.
8	Fabric and fibers provide a large bacterial surface to break down
	solids.
9	An ample air supply and fluctuating liquid levels increase bacterial
	efficiency.

System advantages	An Enviro-Septic <sup>®</sup> wastewater treatment system
auvantages	• costs less than traditional installation products and materials
	• requires a smaller area
	blends into sloping terrain
	adapts to difficult sites
	• installs more easily and quickly than traditional systems
	• eliminates the need for expensive washed stone
	<ul> <li>adapts easily to both commercial and residential sites</li> </ul>
	<ul> <li>uses a protected receiving surface</li> </ul>
	<ul> <li>increases system performance and longevity</li> </ul>

- tests environmentally safer than conventional systems
- recharges groundwater more safely than conventional systems

Enviro-Septic <sup>®</sup> Wastewater Treatment System Operating Manual	Appendix D

#### Section A Introduction

The purpose of this manual is to provide guidance in the design and installation of the Presby Environmental, Inc., Enviro-Septic <sup>®</sup> wastewater treatment system products.	
All systems using Presby Environmental, Inc., Enviro-Septic <sup>®</sup> wastewater treatment system products must be designed and installed in compliance with the procedures and specifications described in this manual.	
Title 5, 310 CMR 15.000, the State Environmental Code for Massachusetts covers issues not addressed in this manual. Title 5 requirements take precedence unless specifically changed by the General Use or Remedial Use approvals issued for the Enviro-Septic <sup>®</sup> system.	
MassDEP and Presby Environmental, Inc., require all designers and installers to be certified. Certification is obtained by attending the "Enviro-Septic <sup>®</sup> Designer and Installer Certification Course" presented by Presby Environmental, Inc., or its sanctioned representatives.	
Until designers and installers are certified, designs and installations must be approved/inspected by Presby Environmental, Inc., or its sanctioned representatives.	
Special Note: Presby Environmental, Inc., recommends that all individuals involved in the approval or permitting process also attend these sessions.	
Installers of Enviro-Septic <sup>®</sup> systems shall provide Presby Environmental, Inc., and the local approving authority with a copy of a completed "System Installation Form" for each new or remedial system installed.	
<u>Reference</u> : See "Appendix A – System Installation Form."	
Presby Environmental, Inc., provides technical support to all individuals using our products. For questions about the information contained in this manual, please review our website at www.presbyenvironmental.com or contact us at 1-800-473-5298.	

### Section B Definitions of Terms

Introduction	This section defines terms as they are used in this manual.
List of terms	Here's a list of the terms defined in this section.
	<ul> <li>Basic serial system</li> <li>Bed</li> <li>Bottom drain</li> <li>Center-to-center spacing</li> <li>Combination serial system</li> <li>Coupling</li> <li>D-Box</li> <li>Design flow</li> <li>Differential venting</li> <li>Distribution box</li> <li>Distribution box system</li> <li>Double offset adapter</li> <li>Drain sump</li> <li>EHGW</li> <li>End cap</li> <li>Enviro-Septic<sup>®</sup> pipe</li> <li>Flow equalizer</li> <li>GPD</li> <li>High and low vents</li> <li>High flow</li> <li>Inground system</li> <li>Low flow</li> <li>Multiple bed system</li> <li>Offset adapter</li> <li>Raised connection</li> <li>Raised connection</li> <li>Section</li> <li>Scioping system</li> <li>Surrounding sand</li> <li>System sand</li> </ul>

## Definitions of Terms, Continued

Basic serial system	A <u>basic serial system</u> is a system consisting of one bed of Enviro-Septic <sup>®</sup> pipe in serial configuration.	
Bed	A <u>bed</u> is 2 or more lines of Enviro-Septic <sup>®</sup> pipe located within a contiguous inground or raised system sand bed area.	
Bottom drain	A <u>bottom drain</u> is a sealed pipe connecting the end of a basic serial system, the ends of all distribution box system lines, or the end of each section of a combination serial system to a sealed drain.	
Center-to-center spacing	<u>Center-to-center spacing</u> is the horizontal distance from the center of one line to the center of the adjacent line.	
Combination serial system	A <u>combination serial system</u> is a system incorporating two or more sections of Enviro-Septic <sup>®</sup> pipe in serial configuration, each section receiving effluent from a distribution box.	
Coupling	A <u>coupling</u> is a fitting that joins two pieces of Enviro-Septic <sup>®</sup> pipe.	
D-Box	<u>D-Box</u> is an abbreviation for distribution box.	
Design flow	<u>Design flow</u> is the assigned peak daily flow of sewage, in gallons per day, from a residence or commercial facility.	
Differential venting	Differential venting is a method of venting an Enviro-Septic <sup>®</sup> system using high and low vents.	
Distribution box	A <u>distribution box</u> is a device used to divide and/or control effluent flow.	
Distribution box manifold	A <u>distribution box manifold</u> is a method of joining any number of distribution box outlets to a single pipe.	
Distribution box system	A <u>distribution box system</u> is a number of Enviro-Septic <sup>®</sup> lines of equal length, each supplied evenly with effluent through a distribution box.	
Double offset adapter	A <u>double offset adapter</u> is an end cap with a two 4" offset holes. Double offset adapters are used in bottom drain installations.	
	Continued	

## Definitions of Terms, Continued

Drain sump	A <u>drain sump</u> is a watertight chamber connected to the end of a bottom drain line.	
	Reference: See Section L, "Bottom Drains and Requirements," p. 38.	
EHGW	EHGW is an abbreviation for estimated high ground-water elevations.	
End cap	An end cap is a cap used at the end of an Enviro-Septic <sup>®</sup> line or section.	
Enviro-Septic <sup>®</sup> pipe	An <u>Enviro-Septic<sup>®</sup> pipe</u> is a single unit of pipe, 10' in length with an outside diameter of 12" and a storage capacity of approximately 58 gallons.	
Flow equalizer	A <u>flow equalizer</u> is an insert installed in each outlet of a distribution box to equalize the effluent distribution for multiple outlets.	
GPD	GPD is an abbreviation for gallons per day.	
High and low vents	High and low vents are pipe components used in all systems to ensure that air is drawn completely through the entire Enviro-Septic <sup>®</sup> system.	
High flow	<u>High flow</u> is a "design daily flow" greater than 500 GPD. High flows require combination or distribution box system designs or multiple serial beds.	
Inground system	An <u>inground system</u> is a system installed with the bottom of the system sand bed below the existing grade.	
Level system	A <u>level system</u> is a system in which lines of Enviro-Septic <sup>®</sup> are installed at the same elevation.	
Line	A <u>line</u> is a number of Enviro-Septic <sup>®</sup> pipes connected by couplings with an offset adapter on the inlet end and an offset adapter on the opposite end.	
Low flow	<u>Low flow</u> is a "design daily flow" of 500 GPD or less. Basic serial system configuration is preferred for low flow systems.	
Multiple bed System	A <u>multiple bed system</u> incorporates two or more beds, each bed with basic serial or combination serial distribution and receiving effluent from a distribution box.	
	Continued	

## Definitions of Terms, Continued

Offset adapter	An offset adapter is an end cap with a 4" offset hole. Offset adapters are used
2 and boot	for raised connections, venting and system inlets.
Raised connection	A <u>raised connection</u> is an arrangement of sewer and drain PVC pipe used to connect lines of Enviro-Septic <sup>®</sup> pipe to maintain the correct liquid level inside each line.
Raised system	A <u>raised system</u> is a system installed with the bottom of the system sand bed at or above the existing grade.
Section	A <u>section</u> is a group of Enviro-Septic <sup>®</sup> lines in serial distribution receiving effluent from a distribution box in a combination system.
Serial distribution	A <u>serial distribution</u> is a group of Enviro-Septic <sup>®</sup> lines connected with a raised connection.
	Reference: See "line," p. 7.
Slope	<u>Slope</u> is the ratio of the difference in elevation and the difference in horizontal distance between two points on the surface of a landform expressed as a percent, and commonly stated as rise over run.
	Example: A slope of one percent is the difference in elevation of one foot (rise) over a horizontal distance of one hundred feet (run).
Sloping system	A <u>sloping system</u> is a system in which lines of Enviro-Septic <sup>®</sup> are installed in decreasing elevations.
Smear	To <u>smear</u> is to mechanically seal the natural pores of soil along an excavated or tilled surface.
Surrounding	Surrounding sand is the sand/soil material adjacent to the system sand.
sand	<u>Reference</u> : See specifications, "Section F – System Sand Requirements," p. 19.
System Sand	System sand is the sand immediately surrounding the Enviro-Septic <sup>®</sup> pipe and is required in all Enviro-Septic <sup>®</sup> installations.
	<u>Reference</u> : See specifications, "Section F – System Sand Requirements," p. 19.

Continued

Enviro-Septic<sup>®</sup> line with the connecting pipe slope not less than 2%.

Depth of cover H-10 / H-20 loading requirements	The minimum total depth of cover on Enviro-Septic <sup>®</sup> lines is 10 inches: 6" of system sand plus 4" of topsoil. Enviro-Septic <sup>®</sup> pipe with 12" of structural cover is designed for H-10 loading, and Enviro-Septic <sup>®</sup> pipe with 18" of structural cover is designed for H-20 loading* (see illustration below).	
	Environmental Inc. The Mass DEP makes no determination that this design meets the H-20 loading requirement.	
Design flow	Design flow is defined in Title 5, 310 CMR 15.002. Design flow criteria are presented in 310 CMR 15.203. When design flow is not established in 310 CMR 15.203, water meter readings can be used in accordance with 310 CMR 15.203 (6). For residential systems, design flows below 330 gallons per day require a variance.	
Designer documentation required	The designer must provide the system owner with copies of the State's Certification for General Use and/or Approval for Remedial Use and an "Enviro-Septic <sup>®</sup> Wastewater Treatment Operating Manual," and a "Technology Checklist." <u>Reference</u> : See "Appendix B, Technology Checklist."	
High flow system configurations	High flow is a "design flow" greater than 500 GPD. High flows in soils with perc rates of up to 60 min/inch require combination or distribution box system configurations or multiple serial beds. All high flow systems in soils with perc rates of 61-90 min/inch require multiple serial beds.	
Inspection Port required	All systems require an inspection port. See Section K , Inspection Port Requirements, p. 37.	
Line elevations	For sloping systems, it is helpful to provide elevations on the design for each line of the system.	
Line orientation	Enviro-Septic <sup>®</sup> lines must be laid level and should run parallel to contours (perpendicular to sloping terrain).	
Loading limits	Each basic serial bed, line of a distribution box system, and section of a combination system has a maximum limit design daily flow of 500 GPD.	
Longer lines preferable	All systems should be designed and installed as long and narrow as possible for the site, with the system length perpendicular to the slope of the natural soil, which is usually parallel to the existing site contour.	
Low flow system configuration	Low flow is a "design flow" of 500 GPD or less. Basic serial system configuration is preferred for low flow systems.	

Maximum / minimum line lengths	No single line of any system may exceed 100' or be less than 30' in length, but the multiple lines of a basic serial system or section of a combination system may total more than 100' in length when connected in series using raised connections.	
	<u>Note</u> : In some instances site conditions may require lines shorter than 30'or systems longer than 100'. These are non-standard system configurations.	
	<u>Reference</u> : See "Section H – Non-Standard System Configurations," p. 31.	
Minimum separation distances	Setback distances are measured from the outer edge of the required system sand. The distances to the estimated high groundwater elevation (EHGW) and other restrictive features are measured from the bottom of the 6" of system sand below the bottom of the Enviro-Septic <sup>®</sup> pipe.	
	<u>Reference</u> : See "Section D – Title 5 and Aggregate Systems Exceptions," p.14	
New construction sizing	For new construction, the system owner initially shall size a soil absorption system in accordance with 310 CMR 15.242 to demonstrate that a conventional Title 5 soil absorption system using aggregate, including a reserve area, can be installed on the site. The system owner may then size the soil absorption system for the Enviro-Septic <sup>®</sup> system.	
Non-standard design requirements	Designers shall include on all non-standard system configuration plans, a statement that Presby Environmental, Inc., will not be responsible for systems designed or installed that do not meet the standards established by these procedures and specifications.	
Percolation rate restriction	General use systems are limited to sites with a percolation rate of up to 60 min/inch. Remedial systems can be constructed where the percolation rate is up to 90 min/inch.	
Pressure distribution lines	The use of pressure distribution lines in Enviro-Septic <sup>®</sup> wastewater treatment systems is prohibited.	
Pumps used to gain elevation	Systems incorporating pumps to gain elevation must use differential venting and velocity reduction to control liquid flow. Velocity reduction may be accomplished through the use of a distribution box with a tee or 90° elbow at the force main outlet.	
	References:See "Section I - Pump System Requirements" p. 33 and "Section J – Venting Requirements," p. 34.Special Note:The use of pressure distribution lines in Enviro-Septic® wastewater treatment systems is prohibited.	

Raised (Mounds) systems minimum fill extensions	All mounded systems shall be designed and constructed in accordance with 310 CMR 15.255. Raised Enviro-Septic <sup>®</sup> systems are designed for sites with soil or depth constraints that do not allow inground configurations Topsoil is required around the fill perimeter of raised systems. <u>Note</u> : All mounded systems shall be designed and constructed in accordance with 310 CMR 15.255. <u>Reference</u> : See detailed diagrams, pp.29-30.
Remedial bed design restrictions – 61- 90 percolation rates	Remedial systems in soils with percolation rates greater than 60 and up to 90 minutes per inch must be designed as basic serial systems. A multiple bed system uses a distribution box with flow equalizers. No bed in a multiple bed system can have a design flow of more than 500 GPD. Beds shall be separated by at least six feet of naturally occurring undisturbed soil. To accommodate construction access, additional separation distance may be necessary.
Reserve area	For new construction a system must contain a reserve area the size of a conventional Title 5 soil absorption system using aggregate. For Remedial systems the system owner must demonstrate that sufficient reserve is not available so that the system can be designed without a reserve area.
Soil moisture construction limitation	If a fragment of soil from about 9" below the surface can easily be rolled into a wire, the soil moisture content is too high for construction.
System Installation Form	Installers of Enviro-Septic <sup>®</sup> systems shall provide Presby Environmental, Inc., and the approving authority with a copy of a completed "System Installation Form" for each new or replacement system installed. <u>Reference</u> : See "Appendix A – System Installation Form."
System size limitation	To meet Massachusetts' requirements, at no time may an Enviro-Septic <sup>®</sup> system be designed to have a sand bed area less than 60% of a conventional Title 5 aggregate system designed in accordance with 310 CMR 15.252 for the same site. In addition, the minimum area for a system installed for new construction shall be 400 square feet.
Ten foot increments work best	It is easier if line lengths are designed in exact 10' increments since Enviro-Septic <sup>®</sup> pipe is 10' in length. However, if necessary, the pipe is easily cut to meet site constraints.
	Continued

Venting requirements	Each Enviro-Septic <sup>®</sup> system must be installed with venting at the end of each distribution box line, section, or serial bed. Vent manifolds may be used to connect multiple vents to one vent outlet.
Wastewater strength	Where wastewater strength exceeds typical human sewage waste, additional Enviro-Septic <sup>®</sup> pipe is required. In some cases additional sand bed area will be required to accommodate the additional pipe. Should designers identify high wastewater strength and need assistance, they may consult Presby Environmental, Inc.

### Section D Title 5 and Aggregate Systems Exceptions

Introduction	Due to the unique capabilities of Enviro-Septic <sup>®</sup> systems, some Title 5 and other requirements commonly associated with aggregate systems do not apply. This page presents some of the more common exceptions.
No septic tank tee filters	Effluent tee filters will not be required for septic tanks used in Enviro-Septic <sup>®</sup> systems.
Serial distribution allowed	Lines of Enviro-Septic <sup>®</sup> pipe may be installed in serial configuration for flows of up to 500 GPD per basic serial bed or combination section.
No pressure distribution	Pressure distribution may not be used with any Enviro-Septic <sup>®</sup> system, including systems that are designed for over 2000 GPD.
Restaurants/ grease traps	Enviro-Septic <sup>®</sup> systems may be used for restaurants and other facilities that use grease traps.
New construction provisions	<ul> <li>These are provisions for new construction.</li> <li><u>Reduced area size</u> Enviro-Septic<sup>®</sup> systems may be installed in an area up to 40% smaller than a conventional Title 5 bed designed in accordance with 310 CMR 15.252.</li> <li><u>Note</u>: The system sizing tables used in this manual identify minimum Enviro-Septic<sup>®</sup> requirements reflecting this reduction.</li> <li><u>Reduction Limitation</u>: Currently Massachusetts limits all systems to a minimum bed size of 400 square feet.</li> </ul>
	Continued

## Title 5 and Aggregate Systems Exceptions Continued

New construction provisions (continued)Minimum vertical separation distances to EHGW In soils with percolation rates of 2 min/in or less the minimum vertical separation distance to the EHGW is 5' measured from the required system sand at the bottom of the Enviro-Septic <sup>®</sup> pipe.	
	In soils with percolation rates greater than 2-60 min/in the minimum vertical separation distance to the EHGW is 4' measured from the required 6" of system sand at the bottom of the Enviro-Septic <sup>®</sup> pipe.
	<u>Minimum naturally occurring pervious soil depth</u> In soils with percolation rates to 60 min/in, the minimum depth of naturally occurring pervious material under a bed is 4', measured from the required 6'' of system sand at the bottom of the Enviro-Septic <sup>®</sup> pipe.
Remedial use provisions	<u>Minimum vertical separation distances to EHGW</u> For remedial systems in soils with percolation rates of 2 min/in or less, the minimum vertical separation distance to the EHGW, measured from the bottom of the 6" of system sand below the Enviro-Septic <sup>®</sup> pipe, may be reduced to 3' if allowed by the local approving authority.
	In soils with percolation rates greater than 2 to 90 min/in, the minimum vertical separation distance to the EHGW, measured from the bottom of the 6" of system sand below the Enviro-Septic <sup>®</sup> pipe, may be reduced to 2' if allowed by the local approving authority.
	Minimum naturally occurring pervious soil depth
	In soils with percolation rates to 90 min/in the depth of naturally occurring pervious material under a bed, measured from the bottom of the 6" of system sand below the Enviro-Septic <sup>®</sup> pipe, may be reduced to no less than 2' if allowed by the local approving authority.

### Section E Installation, Handling, and Storage Guidelines

Introduction	These guidelines must be observed while installing, handling, and storing Enviro-Septic <sup>®</sup> products.	
Site preparation	Here are some site preparation guidelines.	
	• Remove stumps and organic matter under the required sand bed area of a proposed system, including the slope extensions of raised systems.	
	<u>Note</u> : In soils with percolation rates of up to 60 minutes per inch also remove the A Horizon (topsoil).	
	<ul> <li>Maintain the existing characteristics of the underlying soil as much as possible.</li> <li>Add the system sand and/or surrounding sand on the same day that the leach area is excavated.</li> <li>Do not allow water to run into or over the system during construction.</li> <li>Do not work wet or frozen soils.</li> <li>Do not smear or compact soils while preparing the site.</li> </ul>	
	<u>Reference</u> : See "smear," p. 8.	
	Note: Excavation irregularities shall be filled with system sand or Title 5 fill.	
Soil moisture construction limitation	If a fragment of soil from about 9" below the surface can easily be rolled into a wire, the soil moisture content is too high for construction.	
Soil compaction	Minimize machine movement to avoid soil compaction and destruction of the soil structure under and around the system. Be careful not to compact soil on the down slope side of the system.	
Level line tolerances	Use a laser level or transit to install lines level. Variations beyond $\frac{1}{4}$ " may affect system performance. Variations beyond 1" are not acceptable.	
Backfilling lines	Spread system sand between the lines; carefully walk between the lines to insure system sand fills all void spaces beneath the Enviro-Septic <sup>®</sup> pipe. Finish spreading system sand to the top of the lines.	
Backfilling and final grading	Spread a minimum of 6" of system sand over the pipe. Spread the remaining surrounding sand and a minimum of 4" of topsoil. Final grading should shed water away from the system.	
	Note: A tracked vehicle may be used to spread the system sand and topsoil as long as it maintains at least 12" of cover over the pipe.	

#### Installation, Handling, and Storage Guidelines, Continued

**Erosion control** Protect the site from erosion by proper grading, mulching, seeding, and control of runoff. Use raised Raised connections consist of offset adapters, 4" PVC sewer and drain pipe, connections and 90° elbows. Use raised connections to connect lines of Enviro-Septic® pipe. They enable greater liquid storage capacity and increase the bacterial surfaces being developed. Here are some diagrams along with installation notes. Installation Notes: **Г**<sup>1″</sup> 1. Insert PVC pipe no more than 4" into the offset 4″ adapter to prevent air locking. 2. Install the raised connection so that the top of OFFSET ADAPTER the  $90^{\circ}$  bend is level with the top of the offset adapter. 7 / 3. Pack sand under and around the raised connection to prevent movement. TOP VIEW SIDE VIEW END VIEW ENVIRO-SEPTIC PIPE LEVEL 90° PVC Bend PVC Pipe OFFSET ADAPTER OFFSET ADAPTER €MAX. 4" 4" PVC Pipe 90° PVC Bend

**Line spacers** Sand may be used to keep pipe in place while covering, but simple tools may also be constructed for this purpose. Here are two examples. One is made from rebar, the other from wood.

Caution: Remove all tools used as line spacers before final covering.

## Installation, Handling, and Storage Guidelines, Continued

Storage	The outer fabric of the Enviro-Septic <sup>®</sup> pipe is ultra-violet stabilized. However, the protection breaks down after a period of time in direct sunlight. To prevent damage to the fabric, cover the pipe with an opaque tarp.
	Store pipe on high and dry areas to prevent surface water and soil from entering the pipes or contaminating the fabric prior to installation.
	<u>Contamination Note</u> : Keep mud, grease, oil, etc., from all system components. Avoid dragging pipe through wet or muddy areas.

### Section F System Sand Requirements

This page describes the system sand requirements for the Enviro-Septic <sup>®</sup> wastewater treatment system.	
<u>All configurations</u> of Enviro-Septic <sup>®</sup> require a minimum of 6" of system sand surrounding the circumference of the pipe.	
Percentage Restrictions35% or less of the total sand may be gravel.40%-90% of the total sand is to be coarse and very coarse sand.Gravel Quality RestrictionsNo gravel is to exceed <sup>3</sup> / <sub>4</sub> " in diameter.No gravel is smaller than 2mm/.0787" in diameter. (It must not pass through a #10 sieve.)Coarse Sand Quality RestrictionsNo coarse sand is smaller than 0.5mm/.0196" in diameter. (It must not pass through a #35 sieve.)Fines Quality RestrictionsNo more than 3% of the total sand may pass through a #200 sieve.ASTM Standard C-33 is an alternate acceptable material for use as System Sand.	
Surrounding sand should be either system sand or Title 5 fill, 310 CMR 15.255 (3). Only surrounding sand may be placed under raised systems or where top soil and soil horizons with organic matter have been removed.	
Raised systems require extensions. <u>References</u> : See "Raised (Mounds) systems minimum fill extensions," p. 12 and 310 CMR 15.255.	
Sand beds sloping 10% or less require the system sand area to extend a minimum of 1 foot around the perimeter of the Enviro-Septic <sup>®</sup> pipe. Sand beds sloping greater than 10% require the system sand area to extend a minimum of 1 foot around the perimeter of the Enviro-Septic <sup>®</sup> pipe, and an additional 6" of system sand, measured from the bottom of the Enviro-Septic <sup>®</sup> pipe, must extend 3' on the downslope side. <u>References</u> : See "Inground System Sections" diagrams, p. 28 and "Raised (Mounds) System Sections" diagrams, pp. 29-30.	

### Section G Standard System Configurations

Preview	otandala oyotom oomigalationo
Introduction	This section presents the standard system configurations in which Enviro-Septic <sup>®</sup> systems may be installed.
Low flow systems	Low flow systems in soils with perc rates up to 60 min/inch may use any of the configurations described in this section. Percolations rates of 61-90 min/inch require basic serial or multiple basic serial bed designs.
	Reference: See "Low flow," p. 7.
High flow systems	High flow systems in soils with perc rates up to 60 min/inch must be designed as combination or distribution box systems or as multiple bed systems. Percolations rates of 61-90 min/inch require basic serial or multiple basic serial bed designs.
	Reference: See "High flow," p. 7.
Line configurations	<ul> <li>Enviro-Septic<sup>®</sup> systems may be designed in three line configurations.</li> <li>1. Basic serial</li> <li>2. Combination</li> <li>3. Distribution box</li> </ul>
Elevation and slope configurations	These line configurations may be designed as inground or raised (mounds) systems on level or sloping terrain.
Sloping systems	The percentage of slope refers to the slope of the Enviro-Septic <sup>®</sup> system, <u>not</u> the existing terrain. The maximum sand bed slope for all systems is 25%. The maximum site slope is 3:1 (33%). A sloping system can be designed with more than one distinct slope and/or center-to-center pipe spacing in the same system.
Line orientation	Enviro-Septic <sup>®</sup> lines must be laid level and should run parallel to contours (perpendicular to sloping terrain).
Velocity reduction	If the slope of piping from the septic tank to the Enviro-Septic <sup>®</sup> is 10% or more up to a length of 50', or 5% or more for lengths over 50', a velocity reducer is necessary in the D-Box. A baffle or an inlet tee may be an adequate velocity reducer.
	Continued

## Preview, Continued

Pump system definition	A pump system uses a pump to elevate effluent to a D-Box which is required for velocity reduction in a basic serial system and also equally distributes effluent in combination, distribution box, or multiple bed systems.	
In this section	This section contains the following subjects.	
	Subject	Page
	Basic Serial Systems	22
	Combination Systems	23
	Distribution Box Systems	25
	Multiple Bed Systems	26
	Inground System Sections	28
	Raised (Mounds) System Sections	29
		÷

# **Basic Serial Systems**

Introduction	Basic serial distribution is preferred for single beds of 500 GPD or less and multiple bed systems where each bed receives 500 GPD or less. Basic serial distribution is quick to develop a strong biomat in the first line, providing improved effluent treatment. Basic serial distribution provides a longer flow route to allow decomposition of solids and greases, providing improved long term treatment.	
Definition	A basic serial system is a single bed with a series of Enviro-Septic <sup>®</sup> lines connected at the ends with raised connections, using offset adapters and PVC pipe. One offset adapter is installed at the single inlet, and one offset adapter installed at the end of the system is connected to a single vent.	
Line length	Each line of a basic serial system has a maximum length of 100'.	
Basic serial system diagram	Here's a plan view of an Enviro-Septic <sup>®</sup> basic serial system. <u>Note</u> : All systems require an inspection port (not shown). See Section K.	
	D-BOX ENVIRO-SEPTIC LINES OFFSET ADAPTERS COUPLINGS RAISED CONNECTIONS OFFSET ADAPTERS OFFSET ADAPTER OFFSET ADAPTERS SYSTEM SAND 1' BEYOND LINES OFFSET ADAPTER TO VENT ADDITIONAL 3' SAND DOWN-SLOPE SIDE OF SYSTEMS > 10%	

## **Combination Systems**

Introduction	Combination distribution is required for systems with greater than 500 GPD and for multiple bed systems where each section receives no greater than 500 GPD. Combination distribution is quick to develop a strong biomat in the first line of each section providing improved effluent treatment. All systems require a distribution box for use as an observation port. Combination systems also use the same distribution box for dividing flow to multiple serial sections to provide longer flow routes to allow decomposition of solids and greases, providing improved long term treatment.
Definition	A combination system is a bed of two or more sections of Enviro-Septic <sup>®</sup> lines in serial configuration supplied equally through a distribution box. Each section of a combination system is a series of Enviro-Septic <sup>®</sup> lines connected at the ends with raised connections, using offset adapters and PVC sewer and drain pipe. An offset adapter is installed at each section inlet, and at the end of each section where it is connected to a vent or vent manifold.
Loading	Each section of a combination system has a maximum design flow of 500 GPD.
Flow equalizers required	All distribution boxes that divide effluent flow in pump or gravity systems require flow equalizers in their outlets. Most flow equalizers are limited to a maximum of 10 gallons/minute in gravity systems and 20 gallons/minute in pumped systems. <u>Note</u> : To prevent movement, be sure distribution boxes are placed on a stable
	soil base or concrete pad.
Line length	Each line of a combination system has a maximum length of 100'.
Section length requirement	Each section of a combination system must have at least the same minimum linear feet of pipe. The minimum linear feet of pipe per section is determined by dividing the total linear feet required by the number of sections. A section may exceed the minimum linear length. Lines within a section may vary in length to accommodate site constraints.

#### Combination Systems, Continued

#### **Distribution Box Systems**

Introduction	Distribution box systems are the least preferred configuration and should only be used where site constraints do not allow the use of basic serial or combination systems. Distribution box systems disperse effluent in small amounts into several lines and take a longer time to reach maximum environmental efficiency.
Definition	A distribution box system is a bed with each Enviro-Septic <sup>®</sup> line supplied equally through a distribution box. Each Enviro-Septic <sup>®</sup> line of a distribution box system has one offset adapter at each line inlet and one offset adapter at the end of each line connected to a vent or vent manifold.
Flow equalizers required	All distribution boxes that divide effluent flow in pump or gravity systems require flow equalizers in their outlets. Most flow equalizers are limited to a maximum of 10 gallons/minute in gravity systems and 20 gallons/minute in pumped systems.
	<u>Note</u> : To prevent movement, be sure distribution boxes are placed on a stable soil base or concrete pad.
Line length requirement	Each line of a distribution box system has a maximum length of 100'. Each line of a distribution box system must have the same minimum linear feet of pipe. The minimum linear feet of each line is determined by dividing the total linear feet required by the number of lines.

Distribution boxHere's a plan view of an Enviro-Septic® distribution box system.system diagramNote: Inspection Port required (not shown). Refer to Section K.

## **Multiple Bed Systems**

Introduction	A multiple bed system may be used to accommodate site configuration constraints in soils with percolation rates up to 60 min/inch and is required for systems in soils with percolation rates of 61-90 min/inch when the total bed length required is greater than 102'.
Definition	Multiple bed systems incorporate two or more beds, each bed with basic serial, combination serial, or distribution box configuration receiving effluent from a distribution box.
Flow equalizers required	All distribution boxes used to divide effluent flow require flow equalizers in their outlets. Flow equalizers are limited to a maximum of 10 gallons/minute in gravity systems and 20 gallons/minute in flood dosed systems.
	<u>Note</u> : To prevent movement, be sure distribution boxes are placed on undisturbed soil, sand or pea gravel base, or concrete pad.
Loading	Each basic serial bed, section of a combination system, or line of a distribution box system has a maximum flow of 500 GPD.
Bed length requirement	Each bed must have the same minimum linear feet of pipe. The minimum linear feet of pipe per bed is determined by dividing the total linear feet required in the Enviro-Septic <sup>®</sup> system by the number of beds. A bed may exceed the minimum linear length. Lines within a bed may vary in length to accommodate site constraints only in soils with percolation rate up to 60 min/inch.
	Reference: See "Ten foot increments work best," p. 12.
Separation distances	For remedial systems, multiple beds in soils with percolation rates of 1-90 minutes per inch must be separated by a minimum of <u>six feet</u> of undisturbed natural soil.
	For general use systems, multiple beds in soils with percolation rates of 1-60 minutes per inch must be separated by a minimum of <u>ten feet</u> of undisturbed natural soil.
Multiple bed	Multiple beds should be oriented along the contour of the site.
orientation	<u>Note</u> : All Enviro-Septic <sup>®</sup> systems are recommended to be designed and installed as long and narrow as possible for the site.
	Reference: See "Longer lines preferable," p. 10.
	Continued

#### Multiple Bed Systems, Continued

DiagramsThese multiple bed plan views show a minimum horizontal separation<br/>distance of ten feet, as required in general use systems. If used in remedial<br/>use systems, the minimum horizontal separation distance is reduced to six<br/>feet. Note: Inspection Ports required (not shown). Refer to Section K.

**Basic Serial** 

#### **Inground System Sections**

**Introduction** Inground Enviro-Septic<sup>®</sup> systems are the preferred configuration for sites with no soil constraints to limit placement.

**Definition** Inground systems are configurations where the bottom of the system sand bed is below the existing grade. Note: Inspection Ports required (not shown). Refer to Section K.

#### **Raised (Mounds) System Sections**

Introduction All mounded systems shall be designed and constructed in accordance with 310 CMR 15.255. Raised Enviro-Septic<sup>®</sup> systems are designed for sites with soil or depth constraints that do not allow inground configurations.

DefinitionRaised systems are configurations where the bottom of the system sand bed is<br/>at or above the existing ground. Breakout elevation is the bottom of the System<br/>Sand bed/soil interface. Schematics on this page revised September, 2009.<br/>Note: Inspection Ports required (not shown). Refer to Section K.

-29-

## **Raised (Mounds) Sections with Impervious Barriers**

Application	To be used in conjunction with MassDEP's <u>Guidelines for Design and</u> <u>Installation of Impervious Barriers and Slope Stabilization For Title 5 Systems</u> , which supplements <u>Title 5, 310 CMR 15.255</u> , Systems Constructed in Fill.
Note	Use of an impermeable barrier in accordance with DEP rules can reduce the 15 ft fill extension to 5 ft before beginning the Side Slope Tapers of 3:1. Title 5 fill (surrounding sand) goes to top of barrier. Breakout elevation is bottom of the System Sand bed/soil interface (6 inches below the bottom of the Enviro-Septic® pipes).

### **Section H** Non-Standard System Configurations

Introduction	Non-standard configurations may accommodate system lengths longer than 100' and pipe lines shorter than 30'.
Restriction	No onsite system may be located on concave slopes that concentrate surface flows.
Total linear feet requirement	Each line of a distribution box system and each section of a combination system must have the same minimum linear feet of pipe. A section or line may exceed the minimum linear length. Lines within a section may vary in length to accommodate site constraints.
Non-standard designation	Non-standard system configurations are not allowed for soils with percolation rates of 61-90 min/inch.
Examples	Here are some examples using offset adapters and distribution boxes. Note: Inspection Port required (not shown). Refer to Section K.

Curves

Curved configurations work well around objects, setbacks, and slopes.

Note: Multiple curves can also be used.

Angles Angled configurations generally have one or more specific bends. Lines are angled by bending pipes or through the use of raised connections.

**Trapezoids** This combination system shows a trapezoidal configuration. A secondary purpose of this drawing is to illustrate two sections meeting minimum lengths.

<u>Example</u>: Assume 180 linear feet of pipe is required within a trapezoidal area. Each section requires a minimum of 90 linear feet of pipe. Section #1 consists of 30', 35', and 40' lines for a total of 105'. Section #2 consists of 45' and 50' lines for a total of 95'. Each section contains at least the minimum 90' of pipe.

### Section I Pump System Requirements

Introduction	Pump systems typically supply effluent to Enviro-Septic <sup>®</sup> pipe using a pressured line and a distribution box as a velocity reducer when site conditions do not permit a gravity system. Pumps and chambers shall be designed in accordance with 310 CMR 15.231.
Differential venting	All pump systems must use differential venting. <u>Reference</u> : See Section J, "Venting Requirements," p. 34.
Velocity control	It is important to control the rate at which effluent enters Enviro-Septic <sup>®</sup> pipe. Excessive effluent velocity can disrupt suspended solids that have settled out in the Enviro-Septic <sup>®</sup> pipes.
Velocity reduction	Never pump effluent directly into Enviro-Septic <sup>®</sup> pipes. Pressurized lines must discharge into a velocity reducing distribution box with a baffle, a 90-degree elbow, or a tee fitting. If the design already incorporates a distribution box to divide effluent flow, an additional distribution box may not be necessary.
Pipe length per pumped gallon	Each gallon of effluent pumped per cycle requires a minimum of 1.0' of Enviro-Septic <sup>®</sup> pipe.
Basic System GPM Limit	A maximum of 40 GPM is permitted for each basic serial bed.
GPM per flow equalizer limit	A flow equalizer used in a pump system is limited to a maximum of 20 gallons per minute.
Section or line GPM limit	Each line of a pumped D-Box system or each section of a pumped combination system is limited to a maximum of 20 GPM. Each basic serial bed without a flow equalizer can have a maximum flow of 40 GPM.
Pump cycling	Pump cycling is recommended to be six or more cycles per day.

### Section J Venting Requirements

General rule	Low and high vents are required of all systems to ensure that air is drawn completely through the entire Enviro-Septic <sup>®</sup> system. No additional vents may be located between the high vent and low vent. The opening of the high vent must be at least 10 feet above the opening of the low vent. High vents must provide at least the same flow capacity as low vents. Connections within the system must also have similar flow capacities. <u>Purpose</u> : Venting design, installation, and maintenance must ensure that every linear foot of Enviro-Septic <sup>®</sup> pipe in all serial beds, sections, or lines receives oxygen to accommodate natural biologic activity.
Low vent locations	<ul> <li>Low vents are installed through an offset adapter at the end of each</li> <li>serial system or bed</li> <li>section of a combination system</li> <li>line of a distribution box system.</li> </ul>
High vent locations	<ul> <li>High vents are installed in a variety of locations based on the system design.</li> <li>The roof vent will function as the high vent if there are no pumps, restrictions, or other vents between the low vent and the roof vent.</li> <li>If a restriction is placed between the low vent and the roof vent, a high vent is required through an unused distribution box outlet.</li> <li>In pumped systems a high vent is required through an unused distribution box outlet.</li> </ul>
High vent on D-Box	This diagram shows a high vent installed in a D-Box. This configuration is required in pumped systems or when other restrictions or vents are installed between the low vent and the roof vent. DIFFERENTIAL VENTING (TYPICAL - NOT TO SCALE) HIGH VENT SUPPORT FINAL GRADE DBOX

## Venting Requirements, Continued

**Vent manifolds** A vent manifold can be incorporated to connect the ends of a number of sections or lines of Enviro-Septic<sup>®</sup> pipe to a single vent opening. One 4" vent is required for every 1,000' of pipe. A 6" manifold and vent stack may vent up

to 3,000' of pipe.

Remote vent piping slope Remote vent piping should slope downward toward the system to prevent moisture from collecting in the piping and blocking air passage. If site conditions do not allow the pipe to the vent to slope back toward the system, the low point of the connecting pipe should be drilled to allow drainage provided that the connecting pipe invert is above the highest point of the D-Box and all of the Enviro-Septic<sup>®</sup> lines.

# By-PassBy-Pass venting is used to eliminate the need for a High vent at the field and<br/>can also replace the need for a pump chamber vent. There must be at least 10<br/>ft. of elevation between the roof stack and low vent openings. Illustration of<br/>By-Pass venting on next page.

#### Illustration of By-Pass Venting

## Section K Inspection Port Requirements

Massachusetts requires inspection ports	All soil absorption systems shall have a minimum of one inspection port consisting of a perforated four inch pipe placed vertically down to the naturally occurring soil or sand fill below the System Sand. The pipe shall be capped with a screw type cap and accessible to within three inches of final grade. See Title 5, 310 CMR 15.240 (13.)
Distribution Box not to be used for inspection port	An observation port through the distribution box does <b>not</b> qualify as an inspection port in the bed.
Inspection Port Installation	The bottom of the inspection port is located 6" below the bottom of the Enviro- Septic pipe. The proper placement and installation of the required inspection port is shown in the diagram below.

# Section L Bottom Drains and Requirements

Purpose	Bottom drains aid in the rejuvenation of overloaded or abused systems and are recommended for commercial systems at risk of misuse, under pavement, or in inaccessible areas. Bottom drains allow effluent to be pumped from systems without requiring excavation. Once pumped, systems may be rejuvenated instead of replaced.
Requirements	Bottom drains connect to sealed drain sumps. Here are some drain requirements.
	<ul> <li>The top of the drain sump should be a minimum of 12" above the top of the highest Enviro-Septic<sup>®</sup> pipe.</li> <li>The bottom drain inlet must be a minimum of 18" above the drain sump floor.</li> <li>Level systems may use single drain sumps.</li> <li>Sloping systems may require multiple drain sumps.</li> <li>All bottom drain connections and drain sumps must be sealed.</li> <li>Install only at the end of each basic serial bed, combination serial section, or each distribution system line.</li> </ul>
Double offset adapter	Bottom drains require a double offset adapter at the end of each basic serial bed, combination serial section, or distribution system line.
	DOUBLE OFFSET ADAPTER 2" 1"
End view	Here's an end view of a system with a bottom drain and drain sump connecting each line on a distribution box system.
	VENT MANIFOLD ON D-BOX CONFIGURATION SEALED DRAIN LINE DOUBLE OFFSET ADAPTERS SEALED DRAIN SUMP WITH ACCESS COVER

# Section M System Rejuvenation and Expansion

Introduction	This section covers procedures for rejuvenating systems installed according to this manual, but failing because of misuse. It also explains how to expand existing systems.
Why systems fail	System failures related to misuse or lack of oxygen, almost without exception, are related to the conversion of bacteria from an aerobic to an anaerobic state. Flooding, improper venting, alteration or lack of oxygen, sudden use changes, introduction of chemicals or medicines, and a variety of other conditions can contribute to this problem.
Rejuvenating failing systems	Failing systems need to be returned from an anaerobic to an aerobic state. Most Enviro-Septic <sup>®</sup> systems can be put back on line and not require costly removal and replacement by using the following procedure.
	<ol> <li>Determine the problem causing system failure and repair.</li> <li>Drain the system by pumping out the sump of a bottom drain or by excavating one end of all the lines and removing the end cap or offset adapter.</li> <li>Drain the lines.</li> <li>If foreign matter has entered the system, flush the pipes.</li> <li>Safeguard the open excavation.</li> <li>Guarantee a passage of air through the system.</li> <li>Allow all lines to dry for a minimum of 72 hours.</li> <li>Manually excavate a small area of system sand adjacent to the pipe. Note: System sand in failed systems is blackened by anaerobic bacteria. Rejuvenation returns the sand to nearly its original color.</li> <li>When the system sand color has returned, re-assemble the system to its original design configuration.</li> </ol>
System expansion	Enviro-Septic <sup>®</sup> systems are easily expanded by adding equal lengths of pipe to each line of the original design or by adding additional equal sections.
	Note: All system expansions need to meet State and/or local regulations.
Re-usable pipe	Enviro-Septic <sup>®</sup> components are not biodegradable and may be reused. In cases of improper installation it may be possible to excavate, clean, and reinstall all Enviro-Septic <sup>®</sup> system components.
System replacement	If system components are damaged, remove and replace.

## Section N Quick Reference Guide for Percolation Rates Up to 60 Minutes/Inch

Purpose	The unique Enviro-Septic <sup>®</sup> design provides an infinite number of system configurations that vary in length, width, slope, and shape. The purpose of this guide is to help designers compare layouts for any site quickly and easily.
	We recommend designers read this entire manual before using this Quick Reference Guide.
Exceptions require variance	Exceptions to any requirements used in this quick reference guide require a variance from the local approving authority.
Minimum separation distances	Title 5, 310 CMR 15.000 of the State Environmental Code establishes rules for minimum vertical and horizontal separation distances. Setback distances are measured from the outer edge of the required system sand. The distances to EHGW and other restrictive features are measured from the bottom of the 6" of system sand below the Enviro-Septic <sup>®</sup> pipe.
System configuration	Basic serial configuration is recommended for low flow systems. High flow systems are preferably designed as combination systems or multiple serial bed systems, but distribution box systems may also be used.
Procedure	Complete these tasks to size a single level Enviro-Septic <sup>®</sup> system.

#### Task 1: Determine the linear feet of Enviro-Septic<sup>®</sup> pipe required.

Use the percolation rate and the number of bedrooms or the commercial GPD in Table A below to determine the linear feet of Enviro-Septic<sup>®</sup> pipe required.

	Table A: Linear Footage													
Perc rate			Commercial											
Min/Inch	2	3	4	5	6	Add'l Room	Per 100 GPD							
1-9	100	150	200	250	300	50	50							
10-13	110	165	220	275	330	55	55							
14-19	120	180	240	300	360	60	60							
20-30	130	195	260	325	390	65	65							
31-40	140	210	280	350	420	70	70							
41-50	150	225	300	375	450	75	75							
51-60	160	240	320	400	480	80	80							

Example: A three-bedroom home with an 18 min/inch percolation rate requires 180 feet of pipe.

Note: Each bedroom has a design flow of 110 GPD.

Minutes/Inch, Continued

#### Task 2: Determine the percentage of slope on the proposed system.

<u>Note</u>: The maximum slope for a system is 25%. However, the site slope may be greater if fill or excavation is used to keep the system slope within the maximum.

Do you know the percentage of slope on the proposed system?

If yes, go to Task 3.

If no, follow this procedure to determine the percentage of system slope.

Step	Action
1	Identify the highest elevation of the proposed system site.
2	Identify the lowest elevation of the proposed system site.
3	Subtract the lowest elevation from the highest elevation = elevation
	change.
4	Measure the horizontal distance between the two elevations =
	horizontal length.
5	Divide the elevation change by the horizontal length = percentage of
	site slope.
6	Choose a percentage of slope to be used for the system.
	<u>Note</u> : The system slope does not need to be the same as the site slope.
7	Go to Task 3.

#### Task 3: Determine the minimum center-to-center pipe spacing.

Use the percolation rate and the percentage of system slope in Table B below to determine the required minimum center-to-center pipe spacing.

#### Table B: Pipe Spacing

Percentage of		Percolation Rate Min/Inch								
System Slope	1-10	11-20	21-30	31-40	41-50	51-60				
0-10%	1.5'	1.5'	1.75'	2.0'	2.5'	3.0'				
11-15%	1.5'	1.75'	2.0'	2.25'	2.75'	3.25'				
16-20%	1.75'	2.0'	2.25'	2.5'	3.0'	3.5'				
21-25%	2.0'	2.25'	2.5'	2.75'	3.25'	3.75'				

Example: A slope of ten percent or less with an 18 min/inch percolation rate requires pipe spacing of 1.5'.

Minutes/Inch, Continued

Task 4:	Determine	pipe	line	layout.
---------	-----------	------	------	---------

IF	THEN use Table C below to
system length is not	• find the pipe "Line Length/Ft" in the left column
a limiting factor	• follow that row across to a number equal to or greater than the
(preferred)	required "Linear Feet of Enviro-Septic <sup>®</sup> "
	• follow that column down through the "# of Lines" row and across
	left to the required "Ctr to Ctr Spacing."
system length is a	• find the "Ctr to Ctr Spacing" in the bottom left hand column and
limiting factor	follow that row across to the desired layout width
_	• follow that column up through the "# of Lines" row and up to the
	required linear feet of Enviro-Septic <sup>®</sup>
	• follow that row left to determine the pipe line length.

Note: Dark shading in table highlights figures used in the example.

## Minutes/Inch, Continued

#### Task 5: Calculate the total system sand bed area.

Massachusetts requires that Enviro-Septic<sup>®</sup> systems be no less than 60% of the area of a pipe and aggregate system and no less than 400 square feet. Complete this task to determine area size.

Add two feet to the layout width and line length from Table C and multiply them together to obtain the sand bed area in sq.ft. For sloping systems greater than 10%, add 5 feet to the system width and two feet to the pipe length and multiply them together. (The 5 foot width accounts for the 4 foot sand bed extension required on slopes of 10% or more.)

If the area calculated above is less than the minimum sand bed area size required by Massachusetts in Table D, see "Increasing sand bed area footage", next page.

# Minutes/Inch, Continued

Increasing sand bed area footage	Our 3-bedroom home requires 180 linear feet of pipe at 1.5' on center. Using Table C, with 30' lines the system width is 8.5' with a sand bed area of 32'x10.5' for a total of 336 square feet of sand bed. To meet the Massachusetts minimum bed area requirement of 400 square feet for soil class II from Table D, our sand bed area must be increased. Our sand bed area may be increased by adding width and/or length to the system.
	<u>Adding width</u> : To meet the minimum sand bed area size required, the minimum pipe spacing may be increased. Add 2 feet to the pipe length and divide the minimum sand bed area size by that amount to obtain the minimum sand bed width. Subtract 2 feet from the minimum sand bed width and find the line spacing that provides at least that layout width in Table C. For slopes greater than 10%, subtract 5 feet from the minimum sand bed width before referring to Table C for line spacing.
	Adding width example: To increase the sand bed area footage in our example by adding width, divide 400' by 32' to obtain a minimum sand bed width of 12.5'. Subtract 2' from that to obtain the minimum layout width of 10.5'. Table C indicates that a line spacing of 1.75' on center provides a layout width of only 9.75' for a 6-line system, therefore, a line spacing of 2.0' on center and a layout width of 11' is needed to provide a sand bed width of 13' to meet the required 12.5' minimum sand bed width. This now gives us a sand bed area of 416 square feet (13'x32') and a system configuration of 6-30' lines spaced 2' on center.
	<u>Adding length:</u> Add 2 feet to the system width (5 feet for slopes over 10%) and divide the minimum sand bed area size by that amount to obtain the minimum sand bed length required. Subtract 2 feet from the minimum sand bed length to obtain the pipe line length.
	Adding length example: To increase the sand bed area footage in our example by adding length, divide 400' by 10.5' to obtain a sand bed length of 39'. Subtract 2' from that to obtain a line length of 37'. 39'x10.5' equals 410 square feet of sand bed area. The system configuration would be 6-37' lines spaced 1.5' on center.
	<u>Note</u> : This example uses 6-37' line lengths. Limiting pipe to 5' and 10' lengths makes systems simpler to construct. This system would be more easily installed as 6-40' lines, eliminating the need to cut the pipe.

## Section O Quick Reference Guide for Percolation Rates of 61-90 Minutes/Inch

-					
Introduction	Systems in high-density soils or soils with slow percolation rates are limited in configuration to adequately disperse and treat effluent and minimize groundwater mounding.				
Purpose		The purpose of this guide is to help designers choose system layouts for percolation rates in the 61-90 minutes/inch range.			
	We recommend designers read this entire n Reference Guide.	nanual before using this Quick			
Restriction	Installations in soils with percolation rates to remedial use systems only.	of 61-90 minutes/inch are restricted			
Exceptions require variance	Exceptions to any requirements used in this variance from the local approving authority				
Minimum separation distances	Title 5, 310 CMR 15.000 of the State Envir establishes rules for minimum vertical and Setback distances are measured from the or sand. The distances to EHGW and other re the bottom of the 6" of system sand below	horizontal separation distances. uter edge of the required system estrictive features are measured from			
Slope percentages allowed	Use Table E below to determine the maxim <b>Table E – Maximum Slopes for Perc.</b> <b>Perc. Rate</b> 61-70 71-90	1 1 0			
Additional site preparation requirement	For these dense soil systems, plow the system bed and sand extension area to a depth of 12" traveling parallel to the contour of the site. Place 12" of system sand (as measured from existing ground) on the bed area and 6" on sand extensions immediately to protect the site from damage by precipitation.				
	This additional requirement must be includ	ice on the system plan.			

# Minutes/Inch, Continued

**Procedure** Complete these tasks to design a single level Enviro-Septic<sup>®</sup> leaching system with percolation rates between 61-90 minutes/inch.

#### Task 1: Determine the percentage of slope on the proposed system.

<u>Note</u>: The maximum system slope is limited to 15% depending on percolation rates. However, the site slope may be greater if fill or excavation is used to keep the system slope within the maximum.

Do you know the percentage of slope on the proposed system?

If yes, go to Task 2.

If no, follow this procedure to determine the percentage of system slope.

Step	Action
1	Identify the highest elevation of the proposed system site.
2	Identify the lowest elevation of the proposed system site.
3	Subtract the lowest elevation from the highest elevation = elevation
	change.
4	Measure the horizontal distance between the two elevations =
	horizontal length.
5	Divide the elevation change by the horizontal length = percentage of
	site slope.
6	Choose a percentage of slope to be used for the system.
	<u>Note</u> : The system slope does not need to be the same as the site slope.
7	Go to Task 2.

#### Task 2: Choose the proper sizing table.

Sizing tables use the number of bedrooms for homes or the GPD flow in commercial installations to determine system size. System size is the total square footage of sand bed area required for a system. Sand bed area is designed as one or more individual sand beds. Sand bed widths are pre-established at 12', 9', and 6'. Sand bed lengths vary according to percolation rates and slope percentages.

When the system is for	THEN use the following table to complete Task 3.

more than 6 bedrooms	Additional Bedroom Sizing, page 49
commercial use	Commercial System Sizing, page 50

Reference: See Level and Sloping Bed Diagrams, pp. 53-54.

## Minutes/Inch, Continued

#### Task 3: Determine bed(s) widths and lengths.

To determine the number and sizes of beds required, use the proper sizing table identified in task 2.

- 1. Find your percolation rate and slope in the left hand column.
  - Note: Percolation rates/slopes limit system widths to 12', 9', or 6'. No other system widths are allowed without approval by the local approval authority.
- 2. Follow the row(s) across to the "Min. Bed Length" column and choose the longest bed length your site will accommodate. Note: Beds must be 32'-102' in length.
- 3. If the minimum bed length exceeds 102 feet, divide the system into multiple beds of equal length.
  - Example: A minimum bed length of 288' could be designed as 3 beds of 96' each.
  - Note: This example supports using the longest beds possible. Four beds of 72', five beds of 58', etc., are other alternatives. Remember that 32' is the minimum bed length allowable.

#### Task 4: Design beds.

- 1. Design as many beds as required, inserting 4, 3, or 2 lines of Enviro-Septic<sup>®</sup> pipe in each as dictated by the bed width. Note: Pipe is designed 1 foot from the end of the sand bed. Example: A line of pipe in a 96' bed would be 94' long. Reference: See pipe lengths in Table F below
- 2. Use the bed diagrams on pp. 53-54 to aid in the design of each bed.

Based on the bed width and length, this table lists pipe line lengths and total pipe footage in 5' increments.

Total Pipe Ftg.

## Minutes/Inch, Continued

Enviro-Septic <sup>®</sup>	It is possible to keep pipe line lengths as multiples of 10' and avoid cutting a 10' pipe section.
ріре	Example: Let's say we have a 12' x 88' bed (4-lines of pipe) requiring a total pipe footage of 344'. Dividing 344' by 4 would suggest 4 lines of
	86' each. Extending the bed 4 feet would allow 4 lines of 90 feet each and eliminate cutting a section of pipe.

#### Task 5: Increase system size to meet Massachusetts' requirements.

Massachusetts requires that Enviro-Septic<sup>®</sup> systems be no less than 60% of the area of a pipe and aggregate system. Complete this task to determine the area size required by Massachusetts. Use Table G below to find the appropriate minimum sand bed area size required by the State of Massachusetts.

Table G – Minimum Sand Bed Area Size (sq.ft.)

Perc Rate Min/Inch	2-Bedroom	3-Bedroom	4-Bedroom	5-Bedroom	6-Bedroom	Add'l Bedroom	Commercial Per 100 GPD
61-90	880	1320	1760	2200	2640	440	400

Example: Let's say we have a 4-bedroom system in soil with a perc rate of 66 min/inch on a 4% slope. Our 4-bedroom sizing table requires a minimum bed length of 88' with 4 lines and a sand bed width of 12'.

To meet Massachusetts' requirements in Table G, our 4-bedroom house requires a minimum sand bed area size of 1760 sq. ft. The 88' x 12' bed would use 86' line lengths to provide a total of 1056 sq.ft. Instead of cutting the last pipe of each line to 6', the full 10' should be used to provide 4-90' lines. The 90' lines will provide a bed length of 92'. Divide the needed 1760 sq.ft. by the 92' bed to obtain a width of 20'. The 4-90' lines spaced 3' apart should be centered in the 20' by 92' bed.

- Note 1: Sand bed extensions at the pipe ends are limited to 1 foot from the offset adapter for purposes of calculating the effective bed size.
- <u>Note 2</u>: Sand bed extensions on systems sloping 5-15% are limited to 1 foot from the upslope side of the highest pipe for purposes of calculating bed size. Additional bed width must be made on the down slope side.

# Minutes/Inch, Continued

System	Basic serial configuration is required for systems in soils with perc rates of 61-
configuration	90 min/inch. Systems with a design flow greater than 500 GPD must be
requirement	divided into multiple beds. No bed in a multiple bed system can accept more than 500 GPD.

## Massachusetts Department of Environmental Protection Bureau of Resource Protection - Title 5

# DEP Approved Inspection and O&M Form for Title 5 I/A Treatment and Disposal Systems

(Eljen, Enviro-Septic, RUCK, Geoflow)

I certify: I have inspected the sewage treatment and disposal system at the address above, have conducted any required Field Testing and/or sample collection in accordance with Standard Methods, have completed this report and the attached technology operation and maintenance checklist, and the information reported is true, accurate, and complete as of the time of the inspection. I have attended a training course for this System with the Technology Company and am listed by the Company as a trained inspector.

Operator Signature

Date

System owner must submit this report, technology O&M checklist, <u>and</u> any required sampling results to the local board of health and DEP as follows for each inspection performed:

Remedial Use – by January 31st of each year for the previous calendar year

Piloting Use - within 45 days of inspection date

Provisional Use – by March 31<sup>th</sup> of each year for the previous 12 months

**General Use** – by September 30<sup>th</sup> of each year for the previous 12 months

# Appendix D Enviro-Septic<sup>®</sup> Wastewater Treatment System Operating Manual

Introduction	Enviro-Septic <sup>®</sup> wastewater treatment systems are virtually maintenance free. However, an awareness of system abuse and simple easy maintenance will guarantee system longevity.
System abuse conditions	<ul> <li>The following conditions constitute system abuse.</li> <li>Liquid in high volume (excessive number of occupants, leaking fixtures, water beds, or whirlpool tubs, hot tubs, or water softeners if not specified in system design)</li> <li>Solids in high volume (excessive number of occupants, paper products, personal hygiene products, or garbage disposals or water softeners if not specified in system design)</li> <li>Antibiotic medicines in high concentrations</li> <li>Cleaning products in high concentrations</li> <li>Fertilizers or other caustic chemicals in any amount</li> <li>Petroleum products in any amount</li> </ul>
System maintenance	<ul> <li>These simple procedures will guarantee system longevity.</li> <li>Inspect the septic tank at least once every two years under normal usage. Have the tank emptied when surface scum and bottom sludge occupy one-fourth or more of tank capacity.</li> <li>After pumping, inspect the septic tank for integrity to ensure than no groundwater flow is entering septic tank. Also check the integrity of the tank inlet and outlet baffles.</li> <li>Inspect the system for proper venting through either the roof or distribution box vent.</li> </ul>
